

More Graphing Practice:

1. Graph using the most appropriate method:

a)

$$y = -\frac{2}{3}x + 5$$

$$b = 5$$

$$m = -\frac{2}{3}$$

b)

$$3x - 4y = 24$$

$$\begin{aligned} x\text{-int, } y=0 \\ 3x=24 \\ x=8 \end{aligned}$$

$$y\text{-int, let } x=0 \quad x=5$$

$$\begin{aligned} -4y=24 \\ y=-6 \end{aligned}$$

$$(5, 6)$$

$$(5, 4)$$

c)

(Recall: The rule for choosing the x values:)

Use the "standard" values: -2, -1, 0, 1, 2, UNLESS the slope is a fraction.

When a fraction exists, choosing x values which are multiples of the denominator results in "nice" integer values for y .

2. Create a table of values, then graph:

$$y = -\frac{2}{3}x + 5$$

x	y
-6	9
-3	7
0	5
3	3
6	1

$$\begin{aligned} y &= -\frac{2}{3}(\frac{3}{2}) + 5 \\ &= -1 + 5 \\ &= 4 \end{aligned}$$
