

Before we begin, are there any questions from last day's work? 4.4.3

(Today's quiz is NOT based on this material)

## Today's Learning Goal(s):

By the end of the class, I will be able to:

- a) sketch a trigonometric function when the amplitude is changed ( $\neq 1$ )
- b) sketch a trigonometric function when the period is changed. ( $\neq 360^\circ$ )

### 4.5.1 Investigating $y = a \sin x$ and $y = \sin kx$

Date: Apr. 11/18

Using the TI-84, press the MODE button and set the third line to DEGREE, then set the WINDOW

```

Yscl=1
Xres=1
    
```

A. Comparing  $y = a \sin x$  to  $y = \sin x$ , and  $y = a \cos x$  to  $y = \cos x$

1. The graph of  $y = \sin x$  is shown below.

Sketch  $y = 3 \sin x$ ,  $y = -2 \sin x$ , and  $y = \frac{1}{2} \sin x$  on the same grid (below left).

2. The graph of  $y = \cos x$  is shown below.

Sketch  $y = 4 \cos x$ ,  $y = -5 \cos x$ , and  $y = \frac{-1}{4} \cos x$  on the same grid

3. Experiment with different values of  $a$ .

Describe the effects of  $a$  on a trigonometric function.

- ✚  $a$  can vertically stretch or compress a trig function. (see summary for specifics)
- ✚  $a$  can reflect a trig function in the  $x$ -axis. (if  $a$  is negative)

B. Comparing  $y = \sin kx$  to  $y = \sin x$ , and  $y = \cos kx$  to  $y = \cos x$

1. The graph of  $y = \sin x$  is shown below.

Sketch  $y = \sin(4x)$ , and  $y = \sin(0.5x)$  on the same grid (below left).

$\text{period} = \frac{360^\circ}{k}$   
 $\text{period} = \frac{360}{4} = 90^\circ$

2. The graph of  $y = \cos x$  is shown below.

Sketch  $y = \cos(2x)$ , and  $y = \cos\left(\frac{1}{4}x\right)$  on the same grid

$\text{period} = \frac{360}{2} = 180^\circ$   
 if  $k = \frac{1}{4}$   
 $\text{period} = \frac{360}{\frac{1}{4}} = 1440^\circ$

3. Experiment with different values of  $k$ .

Describe the effects of  $k$  on a trigonometric function.

☞  $k$  can horizontally stretch or compress a trig function. (changes the period)

### Summary

If  $y = a \sin x$ , the value  $a$  has the following effect on the function  $y = \sin x$ .

When  $a > 0$ , the function is stretched vertically by the factor  $a$ .

When  $0 < a < 1$ , the function is compressed vertically by the factor  $a$ .

When  $a$  is negative, the function is reflected in the  $x$ -axis.

Changing the value of  $a$  affects the maximum and minimum values, amplitude, and range of the function, but has no effect on the period, or domain.

Changing the value of  $k$  results in a horizontal stretch or compression and affects the period,

changing it to  $\frac{360^\circ}{|k|}$ , but has no effect on the amplitude, maximum and minimum values, domain and range.
