Date: _____

Today's Learning Goal(s):

By the end of the class, I will be able to:

a) sketch sinusoidal functions using transformations.

Last day's work: pp. 383-385 #1 – 4 [12]

6.5 Using Transformations to Sketch Sinusoidal Functions Day2

Date: May 17/19

Ex. 1 Sketch (one cycle) for:

$y = -3\cos(2x - 90^\circ) - 1$

$= -3\cos(2(x - 45^\circ)) - 1$

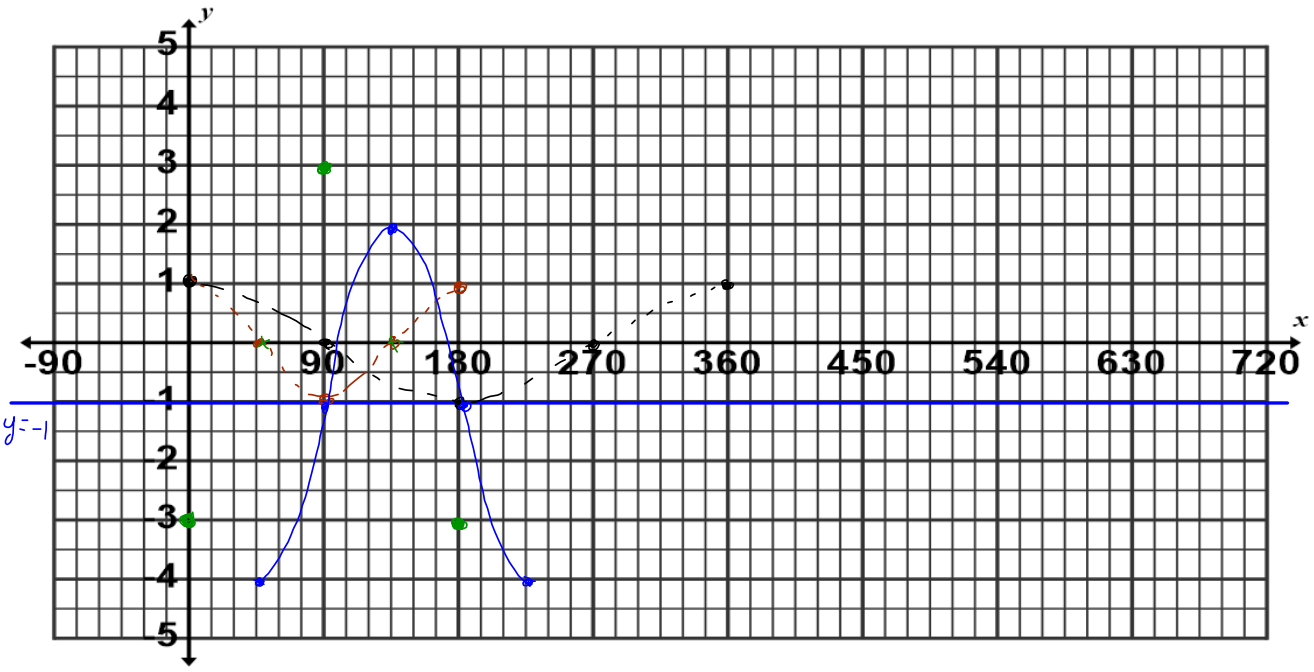
amplitude: 3

period: $\frac{360^\circ}{k} = \frac{360^\circ}{2} = 180^\circ$

phase shift: 45° to the right

equation of the axis: $y = -1$ (vertical shift)

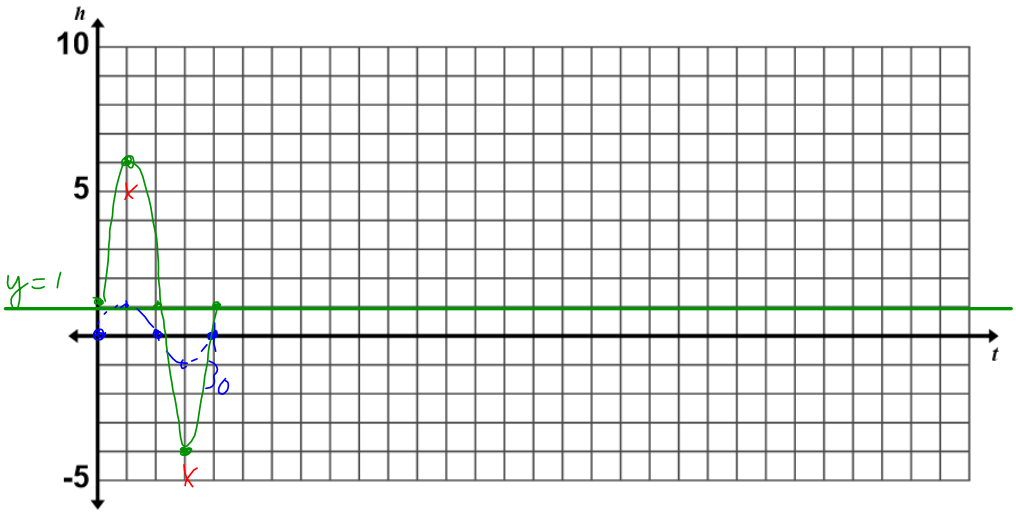
range: $\{y \in \mathbb{R} / -4 \le y \le 2\}$



Ex. 2

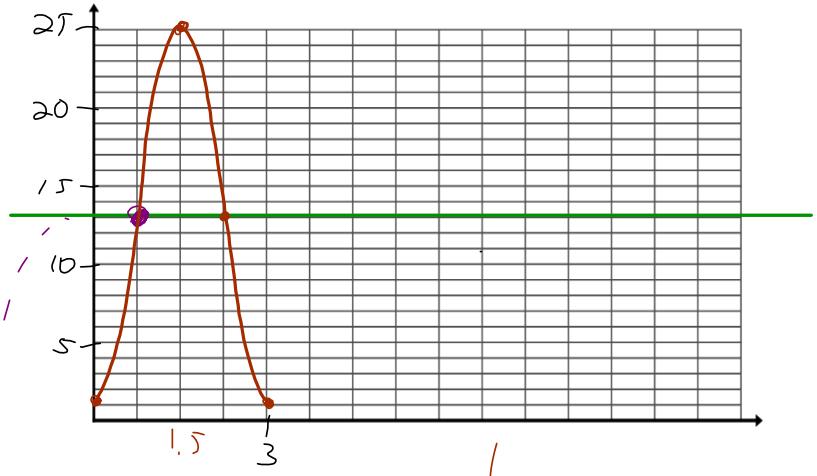
A water wheel turns. The height of a nail at the circumference of the wheel is given by $h = 5\sin(12t)^\circ + 1$. Graph the function.

period
$= \frac{360}{12}$
$= \frac{360}{12}$
$= 30$



(see next screen for a thorough solution, with multiple answers)

Ex. 3 Ron gets on a ferris wheel.
The radius of the wheel is 12 m and he starts 1 m off the ground.
The wheel takes 3 minutes to go around.
Determine "an" equation for Ron's height in terms of the time.



period = 3 min

$\text{period} = \frac{360^\circ}{k}$

$k = \frac{360^\circ}{\text{period}}$

$= \frac{360^\circ}{3}$

$= 120$

radius = 12 $\therefore a = 12$ | $c = 13$

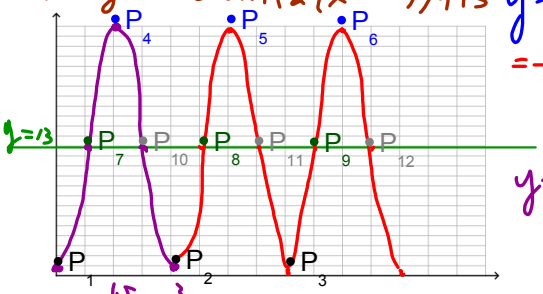
$y = a\sin(k(x-d))+c$ or $y = a\cos(k(x-d))+c$

$y = 12\sin(120(x-0.75))+13$ $y = -12\cos(120(x-0))+13$

For all of the work above,
x is the time in minutes,
and y is the height above the ground, in metres.
(*see next screen if x is time in seconds).

(if time)

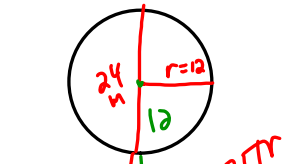
Ex. 3 Ron gets on a ferris wheel.
The radius of the wheel is 12 m and he starts 1 m off the ground.
The wheel takes 3 minutes to go around.
Determine the equation for Ron's height in terms of the time.



Also $y = 12\sin(2(x\ \ ))+13$ $y = a\cos(k(x-d))+c$

$= -12\cos(2(x-0))+13$ or -180

$y = 12\cos(2(x-90))+13$



$C = 2\pi r = 24\pi$

3 min = 180 sec.

min. value = 1 m

max. value = 25 m

amplitude = 12

$period = \frac{360}{k}$

$k = \frac{360}{period} = \frac{360}{180\text{ sec}} = 2$

$k = \frac{360}{3}$ ← min $= 120$

Conclusions:

The final equation depends on two main criteria:
- the point we chose as our "starting point"
- whether we choose a sine vs. cosine function

Note: the units we use may also change the result, as I will show:
It was suggested in class to change the time to seconds, therefore,
the period was 120 seconds, resulting in $k = 2$, and the scale is 45 sec.
Had we left the time in minutes, then $k = 120$, and the scale is 0.75 min.

Choosing points P_1-P_3, uses a cosine curve with a = - 12.

(P_1) $y = -12\cos(2(x-0))+13$

(P_2) $y = -12\cos(2(x-180))+13$

(P_3) $y = -12\cos(2(x-360))+13$

Choosing points P_4-P_6, uses a cosine curve with a = + 12.

(P_4) $y = 12\cos(2(x-90))+13$

(P_5) $y = 12\cos(2(x-270))+13$

(P_6) $y = 12\cos(2(x-450))+13$

Choosing points P_7-P_9, uses a sine curve with a = + 12.

(P_7) $y = 12\sin(2(x-45))+13$

(P_8) $y = 12\sin(2(x-225))+13$

(P_9) $y = 12\sin(2(x-405))+13$

Choosing points P_{10}-P_{12}, uses a sine curve with a = - 12.

(P_{10}) $y = -12\sin(2(x-135))+13$

(P_{11}) $y = -12\sin(2(x-315))+13$

(P_{12}) $y = -12\sin(2(x-495))+13$

Are there any Homework Questions you would like to see on the board?

Last day's work: pp. 383-385 #1 – 4 [12]

Today's Homework Practice includes:

pp. 383-385 #5 – 9 [13]
